Lookalike Address Checklist

4 checks before every crypto send

Crypto sends can’t be reversed. If you paste a lookalike address, the coins are usually gone. Work through these four checks before every send.

- [ ] **Never copy an address from your history** 01

  Scammers send tiny or zero-dollar transfers from an address that starts and ends like one you use, so it shows up in your recent activity. Always copy from a saved contact or the person directly.

- [ ] **Check the whole address, not just the ends** 02

  Lookalike addresses copy the first and last few characters. Compare the middle too, in chunks of four, before every send.

- [ ] **Confirm on the wallet’s own screen** 03

  Clipboard malware can swap what you pasted. A hardware wallet shows the real destination on its own screen, so read the address there before you approve.

- [ ] **A test send is not a safety check** 04

  A small test going through proves nothing if you paste the big send from history afterward. Re-verify the full address every single time.

SPOT THE LOOKALIKE (demo addresses, not real wallets)

Saved contact: `rN7n7otQDd6FczFgLdkpqkqP4EXAMPLESAFE01`

From history: `rN7n7otQDd6FczFgLdFAKEpqkqP4EXAMPLESAFE01`

Same start, same end. The middle is different. That’s address poisoning in one glance.

Print this page. Check each box before every crypto send until it becomes a 10-second habit.
